

Machine Learning in marine traffic data

Possibilities for shipping and coastal engineering

Andreas Ravnstad
Group Manager - Software Engineering & AI

- ▶ Employer: Norconsult Informasjonssystemer AS
- ▶ Title: Group Manager, Software Engineering & AI
- ▶ Education: MSc. Computer Science, NTNU, 2008
- ▶ Life Motto: «*Education is important. But big biceps are importantere*»
- ▶ Interests: Ships not doing what they are supposed to (also other things)

Barteløpet 2017

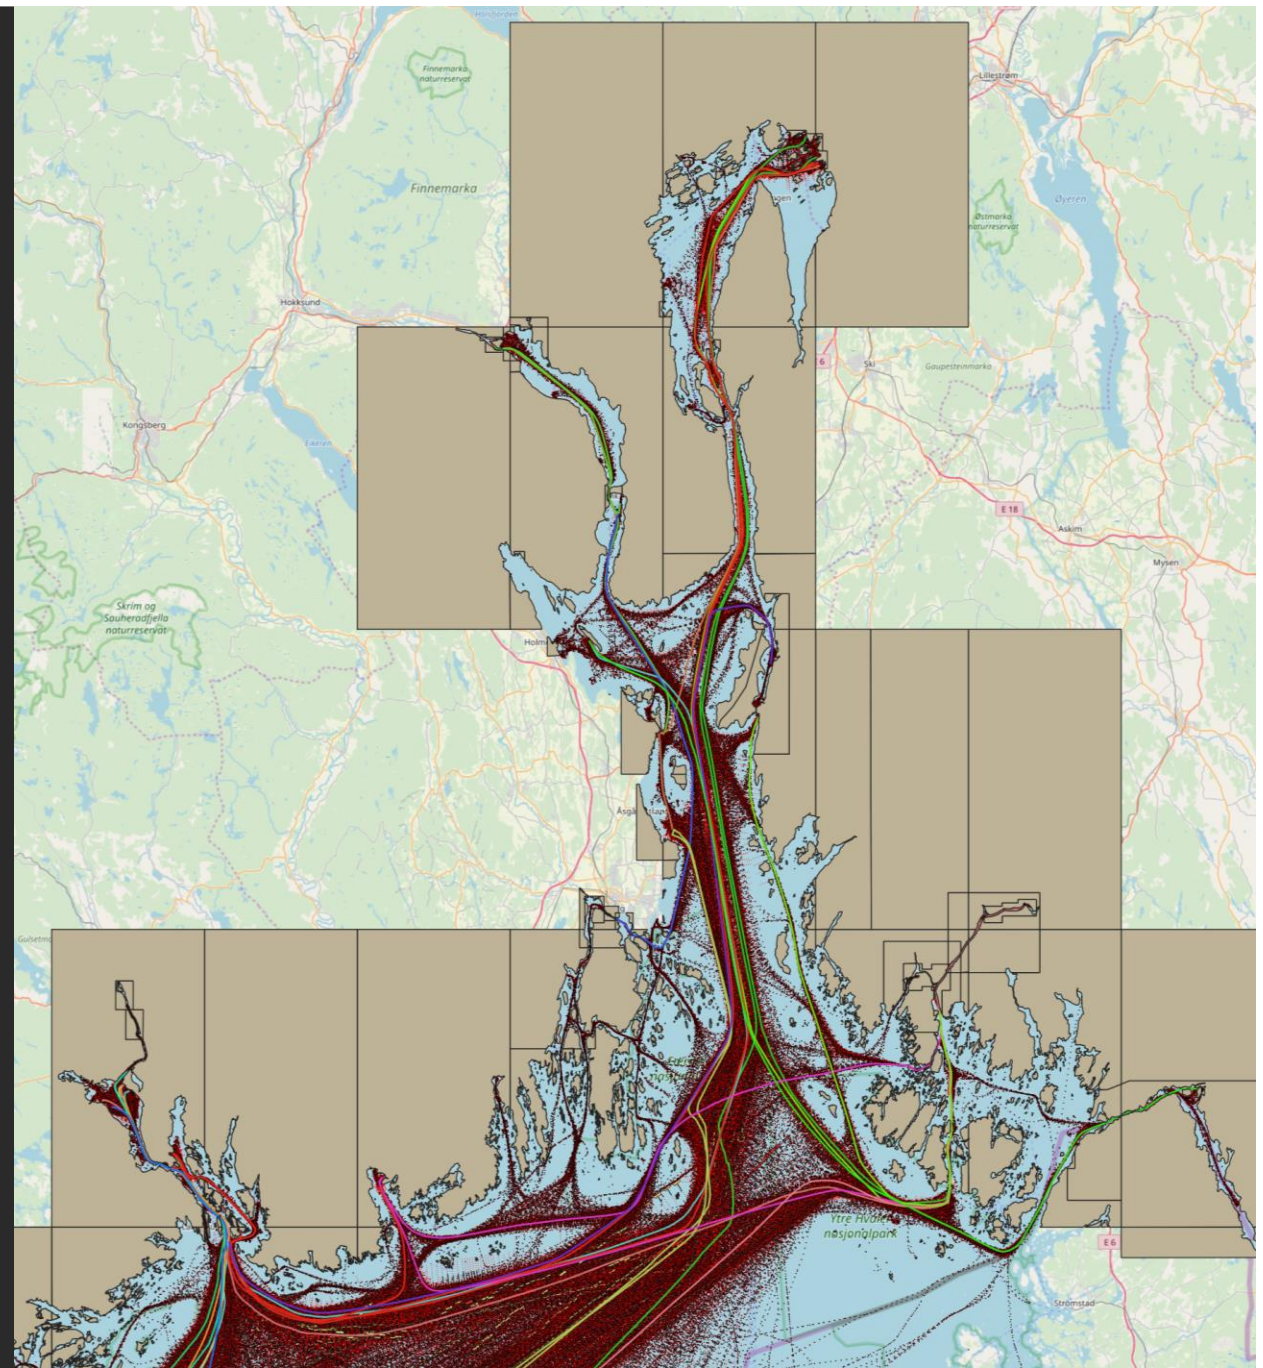

MADARIT

MACHINE LEARNING ANOMALY DETECTION WITH AIS IN REAL TIME

Agenda

- ▶ Method
- ▶ Destination prediction
- ▶ Anomaly detection
- ▶ Grounding prediction
- ▶ ETA prediction
- ▶ Energy consumption prediction

Method

Algorithms

▶ HDBSCAN

- ▶ Density-based Clustering Algorithm
- ▶ Recognizes clusters in spatial data
- ▶ Generates detailed statistics
- ▶ Excels in detecting and removing noise

<https://en.wikipedia.org/wiki/DBSCAN>

▶ Dynamic Time Warping (DTW)

- ▶ Used for speech and hand signature recognition
- ▶ Measures similarity between sequences of data
- ▶ Detects and exploits temporal distortions
- ▶ Excels in temporal shape matching

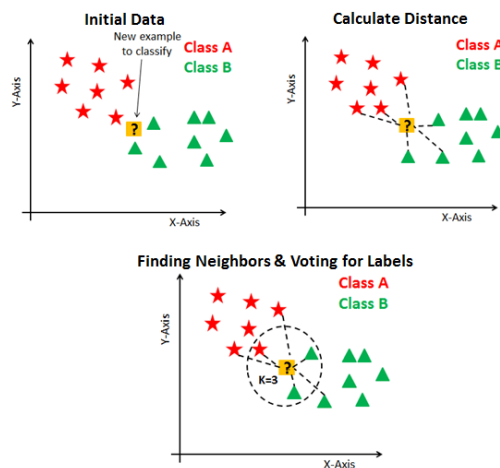

https://en.wikipedia.org/wiki/Dynamic_time_warping

Algorithms, continued

▶ k Nearest Neighbours (kNN)

- ▶ Pattern recognition algorithm
- ▶ Used for classification of voyages to routes
- ▶ Uses DTW as distance metric

▶ CatBoost

- ▶ Gradient boosting over decision trees
- ▶ Used for ranking matching routes

The housecat Boost soon realized he had made a terrible decision that day

https://en.wikipedia.org/wiki/K-nearest_neighbors_algorithm

https://en.wikipedia.org/wiki/Gradient_boosting

Algorithms, continued

► Also, maths

- Very hard
- But we have to do lots of it
- Used for mostly everything
- We cannot escape it

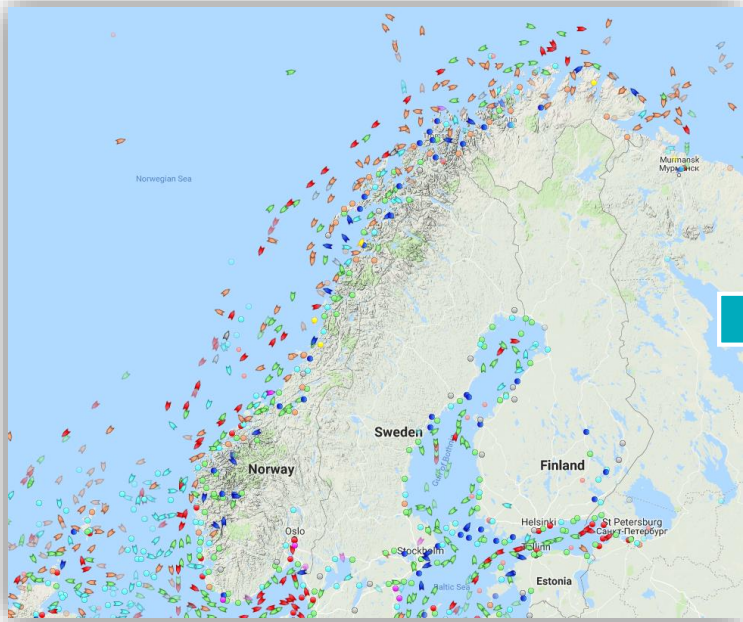

<https://en.wikipedia.org/wiki/Mathematics>

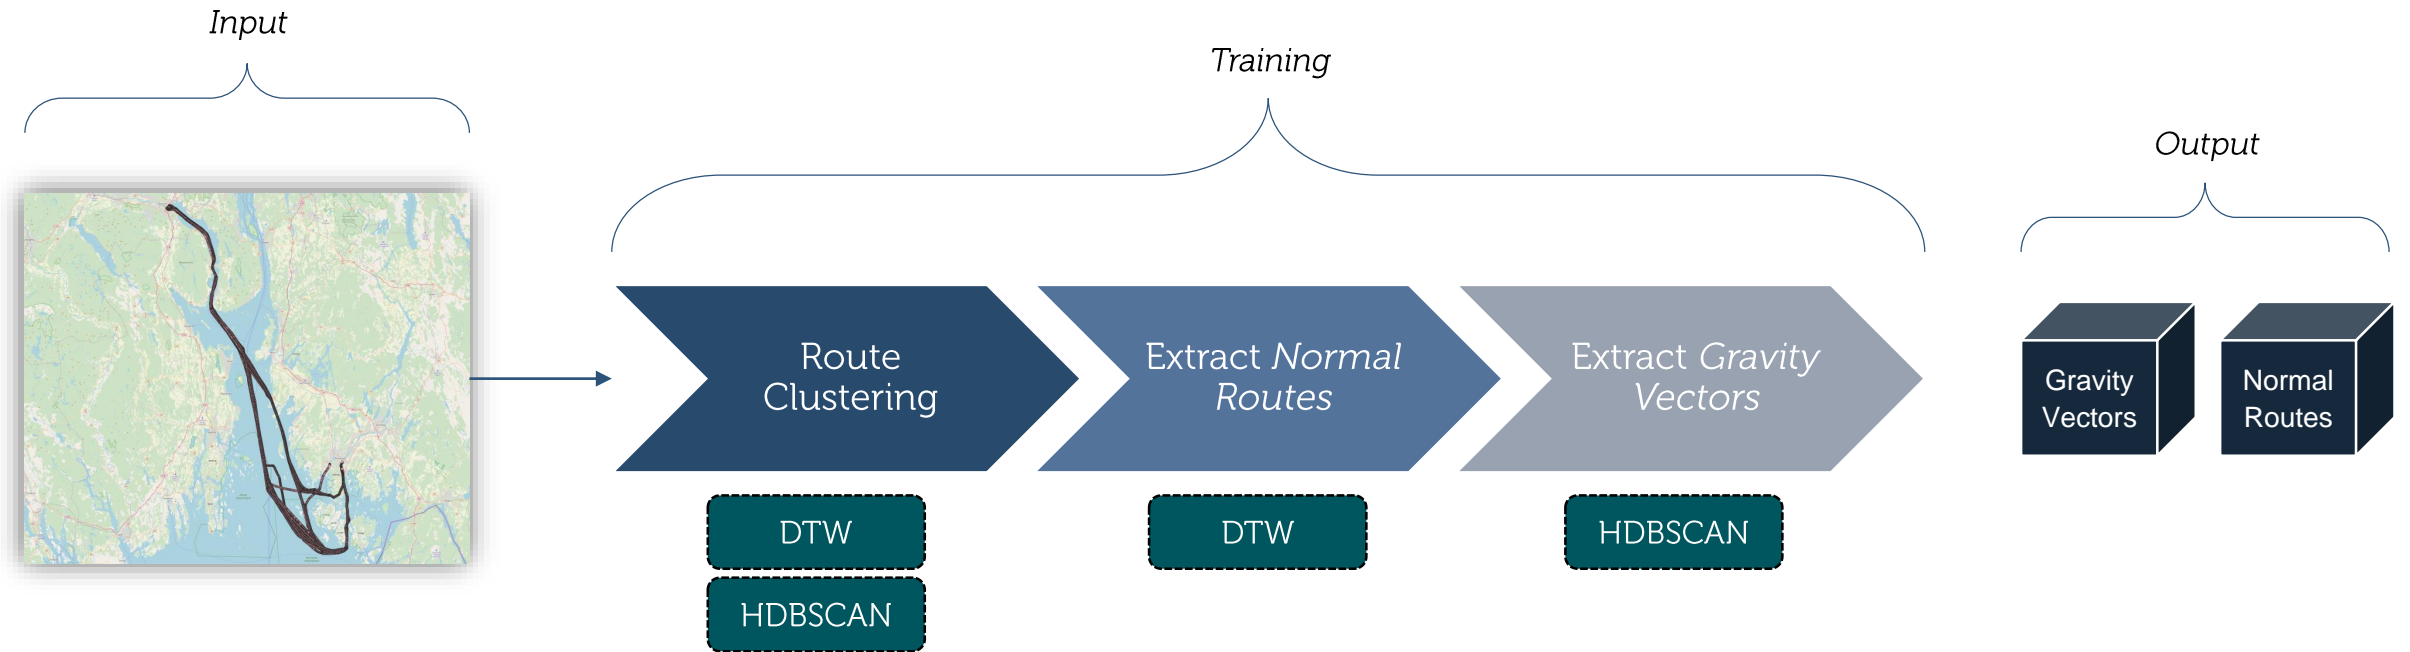

Input data

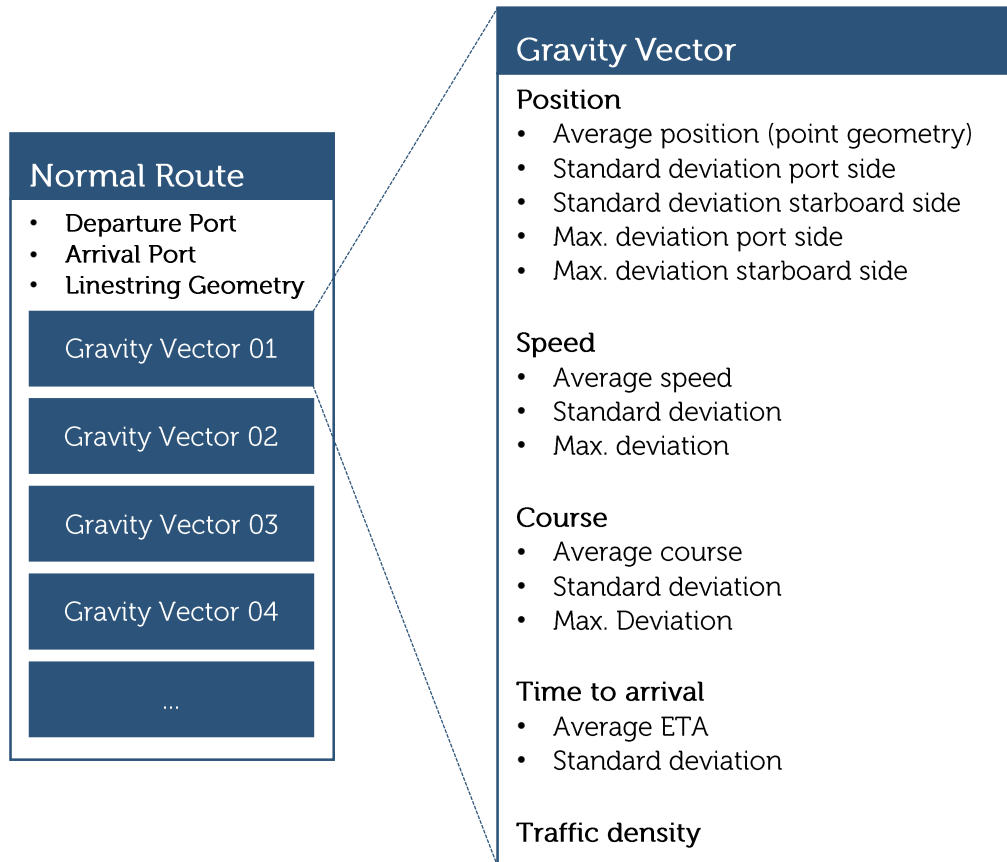

- ▶ 3 years of historical marine traffic data
- ▶ Approximately 3TB in size
- ▶ Cleaned, filtered, and separated into distinct voyages

Training process

What are *Normal Routes* and *Gravity Vectors*?

So.. you're saying that this combination of *machine learning*, *spatial analysis* and *maths* (☹) can warn us about ships that are about to run aground?

Exactly!

Applications for powered grounding prediction

A large red cargo ship named PRISCILLA is shown from a low angle, sailing on the water. The ship's name is visible on the upper part of the hull. The ship has a white superstructure and a dark hull below the waterline. The water is dark and has some ripples. The sky is light and overcast.
