FINITE HOCHSCHILD COHOMOLOGY WITHOUT FINITE GLOBAL DIMENSION

RAGNAR-OLAF BUCHWEITZ, EDWARD L. GREEN, DAG MADSEN, AND ÓYVIND SOLBERG

INTRODUCTION

In [9], Dieter Happel asked the following question: If the Hochschild cohomology groups $HH^n(\Gamma)$ of a finite dimensional algebra $\Gamma$ over a field $k$ vanish for all sufficiently large $n$, is the global dimension of $\Gamma$ finite? We give a negative answer to this question. Indeed, consider the finite dimensional algebras $\Lambda = \Lambda_q = k\langle x, y \rangle / (x^2, xy + qyx, y^2)$ for some field $k$ and $q$ in $k$. These algebras, intensely studied already by Rainer Schulz [13] to exhibit other pathologies, are all four dimensional, of infinite global dimension, and, for $q \neq 0$, selfinjective. If $q$ is not a root of unity in $k$ and non-zero, then we show that the total Hochschild cohomology of $\Lambda_q$ is of dimension 5, thus answering negatively Happel’s question as promised. Moreover, if $q$ is a root of unity, another interesting phenomenon occurs: the Hochschild cohomology vanishes on large, but finite intervals, whose lengths depend on the multiplicative order of $q$.

None of these phenomena can occur for commutative algebras according to the companion paper [1]. Indeed, there it is shown, as a consequence of a more general result, that a commutative finite dimensional algebra $R$ is of finite global dimension as soon as Hochschild cohomology vanishes just in one even and one odd degree, thus giving a strong affirmation of Happel’s question in the commutative case. Let us point out that the family $\{\Lambda_q\}$ contains a few (graded) commutative specimens. For $q = -1$, the algebra $\Lambda_{-1}$ is the commutative complete intersection $k[x, y] / (x^2, y^2)$ and for $q = 1$, the algebra $\Lambda_1$ is the (graded commutative) exterior algebra in two variables, isomorphic to the group ring $k[\mathbb{Z}_2 \times \mathbb{Z}_2]$ in characteristic two. For $q = 0$, that is $\Lambda_0 = k[x, y] / (x^2, xy, y^2)$, we discuss the structure of its Hochschild cohomology in section 3.6.

The Hochschild cohomology ring $HH^*(\Lambda)$ has a ring structure given by the Yoneda product. If $R \to A$ and $S \to A$ are two ring homomorphisms, we denote the fibre product (pullback) by $R \times_A S$.

In this paper we prove the following.

Theorem. (a) If $q$ is not a root of unity and non-zero, then $HH^*(\Lambda)$ is a 5-dimensional algebra over the field $k$ with $\sum_{i \geq 0} \dim_k HH^i(\Lambda) t^i = 2 + 2t + t^2$. Moreover, $HH^*(\Lambda)$ is isomorphic as a ring to the fibre product $k[z] / (z^2) \times_k \Lambda^*(u_1, u_2)$

where $z$ is in degree 0, the elements $u_1$ and $u_2$ are in degree 1 and $\wedge^*(u_1, u_2)$ is the exterior algebra on the generators $u_1$ and $u_2$.

(b) If $q$ is a root of unity, then $\text{HH}^*(\Lambda)$ is an infinite dimensional algebra over the field $k$ and finitely generated as a module over a polynomial subring generated by two elements.

(c) For $q = 0$, then $\text{HH}^*(\Lambda)$ is an infinitely generated algebra over $k$ with

$$\sum_{i \geq 0} \dim_k \text{HH}^i(\Lambda)t^i = \frac{1}{(1-t)^2}.$$

The Hilbert series for the algebras in case (b) are found in sections 3.1 through 3.5.

If $k \subseteq k'$ is a field extension, then $\text{HH}^*(k' \otimes_k \Lambda) \simeq k' \otimes_k \text{HH}^*(\Lambda)$ as graded $k'$-algebras; see, for example, [12, Chap. X, Theorem 7.4]; whence we may, and will, assume that $k$ contains all roots of unity. In fact, then our computations show that the gap of zero Hochschild cohomology groups from degree 3 to the first non-zero group thereafter can be arbitrarily large by choosing $q$ to be a primitive $r$-th root of unity for large $r$.

Let $E(\Lambda)$ be the Koszul dual of $\Lambda$; that is, $E(\Lambda) = \text{Ext}_k^*(k, k)$. Our computations of $\text{HH}^*(\Lambda_q)$ lead to a description of the graded centre of $E(\Lambda_q)$, which is given in section 2.3.

We note that the Hochschild homology of $\Lambda_q$ for $q$ in $k$, is computed in [8]. It is shown there that $\dim_k \text{HH}_n(\Lambda_q) \geq 2$ for all $n \geq 0$.

Throughout we consider right modules unless otherwise explicitly stated. The enveloping algebra $\Lambda^e$ of $\Lambda$ is given by $\Lambda^e$. 1. Background

In this section we try to put Happel’s question into a broader context. We consider six conditions on a finite dimensional algebra and describe how they are interrelated.

Let $\Lambda$ be a finite dimensional algebra over a field $k$ with Jacobson radical $r$. The conditions we consider are the following.

1. $\text{HH}^n(\Lambda)$ vanishes for $n$ sufficiently large.

2. $\text{HH}_n(\Lambda)$ vanishes for $n$ sufficiently large.

3. The global dimension of $\Lambda$ is finite.

4. For every field extension $k'$ of $k$, the global dimension of $k' \otimes_k \Lambda$ is finite.

5. The projective dimension of $\Lambda$ as a $\Lambda^e$-module is finite.

6. The global dimension of $\Lambda^e$ is finite.

Happel’s question is: Does (1) imply (2)? Our results show that this is not true in general, even though it is true in the commutative case [1]. There are some obvious connections; namely, that (3) implies (2), (4) implies (1) and (1'), and (5) implies (4). In general, the following implications hold:

$$
\begin{align*}
(3) & \implies (4) \implies (5) \\
(1) & \implies (2) \implies (1')
\end{align*}
$$

The implication (4) implies (3) is a consequence of [4, Corollary IX.7.2]. If $k$ is algebraically closed, then Happel shows that (3) is equivalent to (4) [9, 1.5]. To see that (3) implies (4) in general, consider a minimal projective resolution $(P, \delta)$.
of \( \Lambda \) over \( \Lambda^e \). If \( k' \) is a field extension of \( k \), then \( (k' \otimes_k \mathbb{P}, 1 \otimes \delta) \) is a minimal projective \((k' \otimes_k \Lambda)^e\)-resolution of \( k' \otimes_k \Lambda \), since \( k' \otimes_k \tau \subseteq \text{rad}(k' \otimes_k \Lambda) \), and for a projective \( \Lambda^e\)-module \( P \), the module \( k' \otimes_k P \) is a \((k' \otimes_k \Lambda)^e\)-module. Taking \( k' \) to be the algebraic closure of \( k \), we see that if the projective dimension of \( \Lambda \) over \( \Lambda^e \) is infinite, then the projective dimension of \( k' \otimes_k \Lambda \) over \((k' \otimes_k \Lambda)^e\) is also infinite. Applying Happel’s result we infer that not (4) implies not (3). The implication (4) implies (5) is found in [14]. In that paper van den Bergh suggests that condition (4) is a reasonable non-commutative version of smoothness.

When \( \Lambda/\tau \) is a separable algebra over \( k \), the conditions (2), (3), (4), and (5) are all equivalent. We have seen that (3), (4), and (5) are equivalent and (3) implies (2) in general. To see that (2) implies (4), we use the following two observations. First note that if \( \Lambda/\tau \) is a separable algebra over \( k \), then \( \Lambda^e/\text{rad}\Lambda^e \) is isomorphic to \( \Lambda/\tau \otimes_k \Lambda/\tau \simeq \text{Hom}_k(D(\Lambda/\tau), \Lambda/\tau) \), where \( D \) denotes as usual the \( k \)-dual. Secondly, \( \text{Ext}^e_k(\Lambda, \text{Hom}_k(D(\Lambda/\tau), \Lambda/\tau)) \) is isomorphic to \( \text{Ext}^e_k(D(\Lambda/\tau), \Lambda/\tau) \) by [4, Proposition IX.4.3]. In particular, if \( \Lambda/\tau \) is a separable algebra over \( k \), (2) implies (1). In general (2) does not imply (1) by the following example. Let \( k \) be a field of characteristic 2, and let \( \Lambda = k(a) \) for some \( a \) not in \( k \) but \( a^2 \) in \( k \). By [10] the Hochschild cohomology ring of \( \Lambda \) is isomorphic to \( k[x, y, z]/(x^2, y^2) \). Hence, the global dimension of \( \Lambda \) is zero, but (1) fails for \( \Lambda \).

If \( \Lambda/\tau \) is not separable over \( k \), condition (2) does not imply conditions (3), (4) and (5) in general. For example, if \( \Lambda \) is a purely inseparable finite field extension of \( k \) of the form \( k(a) \), then \( \Lambda^e \) is a local non-semisimple selfinjective algebra over \( k \). Hence the global dimension of \( \Lambda \otimes_k k(a) \) is infinite.

The results of this paper and [8] show that (1) does not imply (1'). Han [8] also proves that (1') is equivalent to (2) for monomial algebras and for commutative algebras the equivalence was shown by Avramov and Vigué-Poirrier [2]. Han conjectures that (1') and (2) are equivalent.

2. The proof

Let \( \Lambda = \Lambda_0 = k(x, y)/(x^2, xy + qyx, y^2) \) for some field \( k \) and for some element \( q \) in \( k \setminus \{0\} \). Order the elements by length left lexicographic order by choosing \( x > y > 1 \). The set \( \{x^2, xy + qyx, y^2\} \) is then a (non-commutative) Gröbner basis for the ideal \((x^2, xy + qyx, y^2)\), and the normal forms of the elements in \( \Lambda \) are given by \( \{1, x, y, xy\} \) (see [5]). Since \( \Lambda \) has a quadratic Gröbner basis, \( \Lambda \) is a Koszul algebra (see [6]).

First we want to find a minimal projective resolution \((\mathbb{P}, \delta)\) of \( \Lambda \) over \( \Lambda^e \). For each \( n \geq 0 \), we now construct certain elements \( \{f_{i}^{n}\}_{i=0}^{n} \) in \( \Lambda^{e \times n} \), where \( \Lambda^{e \times 0} \) means \( k \). Let \( f_{0}^{n} = 1 \), \( f_{0}^{1} = x \) and \( f_{0}^{1} = y \). By letting \( f_{i}^{n} = 0 = f_{n+1}^{n} \) for all \( n \geq 0 \), we define \( \{f_{i}^{n}\} \) for \( n \geq 2 \) inductively by setting

\[
f_{i}^{n} = f_{i-1}^{n-1} \otimes y + q^{i}f_{i}^{n-1} \otimes x
\]

for \( i \) in \( \{0, 1, \ldots, n\} \). It follows that \( f_{i}^{n} \) is a linear combination of all tensors of \( x \)'s and \( y \)'s of length \( n \) with \( y \) occurring \( i \) times. The coefficient \( q^{i} \) in front of such a \( n \)-fold tensor \( w \) is determined by setting \( \alpha \) equal to the number of \( x \)'s that the \( y \)'s have to move across starting with the \( n \)-fold tensor \( x \otimes \cdots \otimes x \otimes y \otimes \cdots \otimes y \) to obtain the given tensor \( w \). Using this we infer that

\[
f_{i}^{n} = x \otimes f_{i}^{n-1} + q^{n-i}y \otimes f_{i-1}^{n-1}.
\]
Let $P^n = \Pi_{i=0}^n \Lambda \otimes_k f_i^n \otimes_k \Lambda \subset \Lambda^{\otimes_k (n+2)}$ for $n \geq 0$, and let $\tilde{f}_i^n = 1 \otimes f_i^n \otimes 1$ for $n \geq 1$ and $\tilde{f}_0^n = 1 \otimes 1$. Define $\delta^n : P^n \to P^{n-1}$ by letting

$$\delta^n(\tilde{f}_i^n) = x\tilde{f}_{i-1}^{n-1} + q^{n-i}y\tilde{f}_{i-1}^{n-1} + (-1)^n\tilde{f}_{i-1}^{n-1}y + (-1)^nq^i\tilde{f}_{i-1}^{n-1}x.$$ 

Direct computations show that $\delta^2 = 0$.

One can verify directly that $(\mathcal{P}, \delta)$ is a projective $\Lambda^e$-resolution of $\Lambda$ as follows. Let $\Gamma$ be a Koszul $k$-algebra where the degree zero part is a $k$. Suppose that $M$ is a Koszul module over $\Gamma$ for which the Betti numbers $\{b_n\}_{n \geq 0}$ in a minimal projective resolution are known, and that

$$\cdots \to G^n \xrightarrow{d^n} G^{n-1} \to \cdots \to G^1 \xrightarrow{d^1} G^0 \xrightarrow{d^0} M \to 0$$

is a linear complex $G$ of projective $\Gamma$-modules $G^n$ generated by $b_i$ generators in degree $i$, where $d^i : G^0 \to M$ is onto and $d^i|_{G_i^0} : G_i^0 \to G_{i-1}^0$ is injective for all $i \geq 0$. Then it follows easily by induction that $G$ is a minimal projective resolution of $M$.

In our situation we apply this in the following way: Let $d^2 : P^0 \to \Lambda$ be the multiplication map. The algebra $\Lambda^e$ is a Koszul algebra over $k$. By a classical formula of Cartan-Eilenberg $\text{Ext}^2_{\Lambda}(k, \Lambda) \cong \text{Ext}^2_{\Lambda}(k, k)$. The Koszul dual $E(\Lambda) = \text{Ext}^*_\Lambda(k, k)$ of $\Lambda$ is isomorphic to $k(x, y)/(yx - qxy)$, so that the Betti numbers of a minimal projective resolution of $\Lambda$ over $\Lambda^e$ are $\{b_n = n + 1\}_{n \geq 0}$. Moreover by [7] (see [3] for a proof) a graded algebra $\Gamma$ generated in degrees 0 and 1 is Koszul if and only if $\Gamma$ is Koszul as a right module over $\Gamma^e$. Hence $\Lambda$ is a Koszul module over $\Lambda^e$. It is straightforward to check that the above conditions are satisfied for $(\mathcal{P}, \delta)$. Hence $(\mathcal{P}, \delta)$ is a minimal projective resolution of $\Lambda$ over $\Lambda^e$.

Our next immediate goal is to obtain a multiplication formula for elements in the Hochschild cohomology ring; see the formula (1) below. Recall that the bar resolution $B$ of $\Lambda$ over $\Lambda^e$ is given by $B^n = \Lambda^{\otimes_k (n+2)}$ and differential $d_n : B^n \to B^{n-1}$ given by

$$d_n(\lambda_0 \otimes \lambda_1 \otimes \cdots \otimes \lambda_{n+1})$$

$$= \sum_{i=0}^n (-1)^i(\lambda_0 \otimes \lambda_1 \otimes \cdots \otimes \lambda_{i-1} \otimes \lambda_i \lambda_{i+1} \otimes \lambda_{i+2} \otimes \cdots \otimes \lambda_{n+1})$$

Define $\partial_i : B^n \to B^{n-1}$ by

$$\partial_i(\lambda_0 \otimes \cdots \otimes \lambda_{n+1}) = (\lambda_0 \otimes \cdots \otimes \lambda_{i-1} \otimes \lambda_i \lambda_{i+1} \otimes \lambda_{i+2} \otimes \cdots \otimes \lambda_{n+1})$$

for $i = 0, 1, \ldots, n$. Then $d_n = \sum_{i=0}^n (-1)^n \partial_i$.

We view $P^n$ as a submodule of $B^n$ in the natural way. For any given $i$, consider the tensors of the form $w \otimes x \otimes x \otimes w', w \otimes x \otimes y \otimes w', w \otimes y \otimes x \otimes w'$, or $w \otimes y \otimes y \otimes w'$ occurring in a $\tilde{f}_i^n$, where $w$ is an $t$-fold tensor. The first and the last of these are mapped to zero by $\partial_i$. If a tensor $q^i w \otimes x \otimes y \otimes w'$ occurs in some $\tilde{f}_i^n$, then $q^{i+1} w \otimes x \otimes y \otimes w'$ also occurs in $\tilde{f}_i^n$. Then the sum of these elements is mapped to zero by $\partial_i$. It follows from this that the element $\tilde{f}_i^n$ is mapped to the element

$$x\tilde{f}_{i-1}^{n-1} + q^{n-i}y\tilde{f}_{i-1}^{n-1} + (-1)^n\tilde{f}_{i-1}^{n-1}y + (-1)^nq^i\tilde{f}_{i-1}^{n-1}x$$

by the differential in $B$. This shows that $(\mathcal{P}, \delta)$ is a subcomplex of $(\mathcal{B}, d)$.
The bar resolution $\mathcal{B}$ admits a comultiplication $\Delta: \mathcal{B} \to \mathcal{B} \otimes_{\Lambda} \mathcal{B}$, that is a morphism of complexes over the identity on $\Lambda$, given by
\[
\Delta(\lambda_0 \otimes \cdots \otimes \lambda_{n+1}) = \sum_{i=0}^{n} (\lambda_0 \otimes \cdots \otimes \lambda_i \otimes 1) \otimes (1 \otimes \lambda_{i+1} \otimes \cdots \otimes \lambda_{n+1}).
\]
The (cup) product in $\text{HH}^*(\Lambda)$ of two cycles $\eta$ and $\theta$ from $\text{Hom}_{A^e}(\mathcal{B}, \Lambda)$ is given as the composition of the maps
\[
\mathcal{B} \xrightarrow{\Delta} \mathcal{B} \otimes_{\Lambda} \mathcal{B} \xrightarrow{\eta \otimes \theta} \Lambda \otimes_{\Lambda} \Lambda \xrightarrow{\iota} \Lambda,
\]
where $\iota: \Lambda \otimes_{\Lambda} \Lambda \to \Lambda$ is the natural map. Let $\mu: \mathcal{P} \to \mathcal{B}$ be the natural inclusion, and let $\pi: \mathcal{B} \to \mathcal{P}$ be a chain map such that $\pi \mu = \text{id}_{\mathcal{P}}$.

Suppose that the image $\Delta(\mu \mathcal{P})$ is already contained in $\mu \mathcal{P} \otimes_{\Lambda} \mu \mathcal{P} \subseteq \mathcal{B} \otimes_{\Lambda} \mathcal{B}$. In that case, $\Delta$ induces a comultiplication on $\mathcal{P}$ that we denote by $\Delta'$. In particular $\Delta \mu = (\mu \otimes \mu)\Delta'$. For homogeneous elements $\eta$ and $\theta$ in $\text{HH}^*(\Lambda)$ we can represent these elements as morphisms $\eta: P^{m} \to \Lambda$ and $\theta: P^{n} \to \Lambda$. Using the bar resolution they can be represented by $\eta \pi_m$ and $\theta \pi_n$. Then we have
\[
\eta \ast \theta = (\eta \ast \theta)\pi_{m+n} \mu_{m+n} = (\eta \pi_m \cup \theta \pi_n) \mu_{m+n}
\]
\[
= \nu(\eta \pi_m \otimes \theta \pi_n) \Delta \mu_{m+n}
\]
\[
= \nu(\eta \pi_m \otimes \theta \pi_n)(\mu_m \otimes \mu_n) \Delta'
\]
\[
= \nu(\eta \otimes \theta) \Delta'
\]
where $\eta \ast \theta$ denotes the product of $\eta$ and $\theta$ in $\text{HH}^*(\Lambda)$.

Now we show that indeed $\Delta$ maps $\mu \mathcal{P}$ to $\mu \mathcal{P} \otimes_{\Lambda} \mu \mathcal{P}$. Using the description of the terms in $f^n_t$ it is straightforward to verify that
\[
f^n_t = \sum_{j=\min\{t,i\}}^{\min\{t,i\}} q^{j(n-i+j-t)} f^j_j \otimes f^{n-t}_{i-j}
\]
for $t = 0, 1, \ldots, n$. From this we infer that
\[
\Delta(f^n_t) = \sum_{t=0}^{n} \sum_{j=\max\{0,i+t-n\}}^{\min\{t,i\}} q^{j(n-i+j-t)} f^j_j \otimes \lambda_{t-j},
\]
hence we see that $\Delta: \mu \mathcal{P} \to \mu \mathcal{P} \otimes_{\Lambda} \mu \mathcal{P}$ and we can define $\Delta'$ by the above formula.

This enables us to describe the multiplication in $\text{HH}^*(\Lambda)$, which we do next. Let $\eta: P^{m} \to \Lambda$ and $\theta: P^{n} \to \Lambda$ represent elements in $\text{HH}^{m}(\Lambda)$ and $\text{HH}^{n}(\Lambda)$, respectively, where $\eta(f^m_i) = \lambda_i$ for $i = 0, 1, \ldots, m$ and $\theta(f^n_i) = \lambda'_i$ for $i = 0, 1, \ldots, n$. Then
\[
(1) \quad \eta \ast \theta(f^{m+n}_i) = \sum_{j=\max\{0,i-n\}}^{\min\{m,i\}} q^{j(n-i+j)} \lambda_j \lambda'_{i-j}
\]
for $i = 0, 1, \ldots, m + n$. We note that the product $\eta \ast \theta$ in formula (1) is written as a map $P^{m+n} \to \Lambda$, and hence may be zero as an element in $\text{HH}^*(\Lambda)$. In [3] we show that this multiplicative structure can be generalized to any Koszul algebra $\Lambda = kQ/I$ for a finite quiver $Q$.

Now let us consider the vector space structure of $\text{HH}^{n}(\Lambda)$ for all $n \geq 0$. 
Since \( P^n \simeq (\Lambda^*)^{j+1} \), we see that \( \text{Hom}_\Lambda(P^{n-1}, \Lambda) \) is isomorphic to \( \Lambda^n \), which we view as an identification. Let \( \eta: P^{n-1} \to \Lambda \) be given by \( (\lambda_0, \ldots, \lambda_{n-1}) \). Then for \( n \geq 1 \)

\[
\eta \delta^n = (x\lambda_0 + (-1)^n\lambda_0x, \ldots,
\]

\[
x\lambda_j + q^{n-j}y\lambda_{j-1} + (-1)^n\lambda_{j-1}y + (-1)^nq^j\lambda_jx, \ldots,
\]

\[
\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{j-th coordinate}}}}}}}}}}}}}}}}
\]

\[
y\lambda_{n-1} + (-1)^n\lambda_{n-1}y)
\]

The image \( \text{Im}(\delta^n)^* \) is spanned by vectors obtained from the above by choosing \( \lambda_i \) to be in the set \( \{1, x, y\} \), since the value \( yx \) only gives zero. When \( \lambda_j \) is \( x \) or \( y \) and all the other \( \lambda_i \)'s are zero, then the result is a standard basis vector times \( ax \) for some \( a \) in \( k \). Hence this can give rise to at most \( n+1 \) linearly independent elements. When \( \lambda_j = 1 \) and all the other \( \lambda_i \)'s are zero, then the resulting element has the form \((0, \ldots, 0, ax, by, 0, \ldots, 0)\) for some \( a \) and \( b \) in \( k \) and for \( j = 0, 1, \ldots, n-1 \). The non-zero elements of this form are linearly independent and also linearly independent of those obtained by choosing \( \lambda_j \) in \( \{x, y\} \). This shows that \( \dim \text{Im}(\delta^n)^* \leq 2n + 1 \) for \( n \geq 2 \).

When \( \lambda_i = 0 \) for \( i \neq j \) and \( \lambda_j = y \), then

\[
\eta \delta^n = (0, \ldots, 0, (-q + (-1)^nq^j)y, 0, \ldots, 0)
\]

for \( j = 0, 1, \ldots, n-1 \). If \( \lambda_{j-1} = x \) and all other \( \lambda_i \) are zero, then

\[
\eta \delta^n = (0, \ldots, 0, (q^{n-j} - (-1)^nq)y, 0, \ldots, 0)
\]

for \( j = 1, 2, \ldots, n \). The coefficients in the \( j \)-coordinate of these elements are zero if (i) for \( j = 0 \) we have \( q = (-1)^n \), (ii) for \( j = 1, 2, \ldots, n-1 \) we have \( q^{j-1} = (-1)^n \) and \( q^{n-j-1} = (-1)^n \), and (iii) for \( j = n \) we have \( q = (-1)^n \). For each \( j \) such that one of these three cases occurs, the dimension of \( \text{Im}(\delta^n)^* \) "decreases" by one. If \( q \) is not a root of unity and \( n \geq 3 \), then these conditions never hold.

When \( \lambda_i = 0 \) for \( i \neq j \) and \( \lambda_j = 1 \), then

\[
\eta \delta^n = (0, \ldots, 0, (1 + (-1)^nq^j)x, (q^{n-j-1} + (-1)^n)y, 0, \ldots, 0)
\]

for \( j = 0, 1, \ldots, n-1 \). The coefficients in this vector are zero if and only if \( q^j = (-1)^{n+1} \) and \( q^{n-j-1} = (-1)^{n+1} \). If \( q \) is not a root of unity and \( n \geq 2 \), these equations are never satisfied. Hence, when \( q \) is not a root of unity and \( n \geq 3 \), the dimension of \( \text{Im}(\delta^n)^* \) is \( 2n + 1 \).

Using these facts, let us first compute the groups \( \text{HH}_n(\Lambda) \) for \( n = 0, 1, 2 \). We have that

\[
\text{HH}_n(\Lambda) = Z(\Lambda) = \begin{cases} \text{span}_k \{1, yx\}, & q \neq -1 \\ \Lambda, & q = -1 \end{cases}
\]
From the above computations $HH^1(\Lambda)$ is spanned as a vector space in $\text{Ker}(\delta^2)^*/\text{Im}(\delta^1)^*$ by the following maps

\[
\begin{align*}
\{ (x, 0), (y, 0) \}, & \quad q \neq -1, 1 \\
\{ (x, 0), (yx, 0), (0, yx), (0, y) \}, & \quad q = -1, q \neq 1 \\
\{ (x, 0), (y, 0), (0, x), (0, y) \}, & \quad q \neq -1, q = 1 \\
\text{Hom}_x(P^1, \Lambda), & \quad q = 1, \text{char } k = 2
\end{align*}
\]

Similarly as above $HH^2(\Lambda)$ is spanned by the following maps

\[
\begin{align*}
\{ (0, yx, 0) \}, & \quad q \neq -1, 1 \\
\{ (1, 0, 0), (y, 0, 0), (0, yx, 0), (0, x, 0), (0, 0, 1) \}, & \quad q = -1, q \neq 1 \\
\{ (1, 0, 0), (0, 1, 0), (0, 0, 1), (yx, 0, 0), (0, yx, 0), (0, yx, 0), (0, yx, 0) \}, & \quad q \neq -1, q = 1 \\
\text{Hom}_x(P^2, \Lambda), & \quad q = 1, \text{char } k = 2
\end{align*}
\]

2.1. When $q$ is not a root of unity and non-zero. Suppose now that $q$ is not a root of unity. Since $\dim_k(P^n)^* = 4(n+1)$ and $\dim_k \text{Im}(\delta^n)^* + \dim_k \text{Im}(\delta^{n+1})^* = 4(n+1)$ for $n \geq 3$, it follows that $\text{Im}(\delta^n)^* = \text{Ker}(\delta^{n+1})^*$ and $HH^0(\Lambda) = (0)$ for those values of $n$. By the considerations above we have that (i) $HH^0(\Lambda) = \text{span}_k \{1, x, y, yx)\}$, (ii) $HH^1(\Lambda) = \text{span}_k \{(x, 0, 0, y)\}$ and (iii) $HH^2(\Lambda) = \text{span}_k \{(0, 0, 0, 0)\}$. Denote the element $yx$ in $HH^0(\Lambda)$ by $z$ and the two elements $(x, 0)$ and $(0, y)$ in $HH^1(\Lambda)$ by $u_0$ and $u_1$, respectively. Using the multiplication worked out earlier, it is straightforward to compute that the elements $\{z^2, zu_0, zu_1, z^2u_1, u_0^2, u_1^2\}$ are all zero, while $u_0u_1 = -q(0, yx, 0)$ and $u_1u_0 = q(0, yx, 0)$. Hence $HH^*(\Lambda)$ is isomorphic to the fibre product

\[k[z]/(z^2) \times_k \wedge^*(u_0, u_1),\]

where $\wedge^*(u_0, u_1)$ is the exterior algebra on the generators $u_0$ and $u_1$.

2.2. When $q$ is a root of unity. Suppose now that $q$ is a primitive $r$-th root of unity. Fix an $n$. Whenever $\dim_k \text{Im}(\delta^n)^* < 2n + 1$ for the group $HH^i(\Lambda) \neq (0)$ for $i \in \{n - 1, n\}$. We observed above that this happened if

(a) (i) for $j = 0$ we have $q = (-1)^n$,

(ii) for some $j = 1, 2, \ldots, n - 1$ we have $q^{j-1} = (-1)^n$ and $q^{n-j-1} = (-1)^n$,

(iii) for $j = n$ we have $q = (-1)^n$,

(b) for some $j = 0, 1, \ldots, n - 1$ we have $q^j = (-1)^{n+1}$ and $q^{n-j-1} = (-1)^{n+1}$.

When $j = 1$ and $n - 2 = mr$ with $n$ even for some $m \geq 1$, then condition (a)(ii) is satisfied. When $j = 0$ and $n - 1 = mr$ with $n$ odd for some $m \geq 1$, then condition (b) is satisfied. This shows that when $q$ is a root of unity, then $HH^*(\Lambda)$ is infinite dimensional over $k$.

The Koszul dual $E(\Lambda)$ of $\Lambda$ is isomorphic to $k(x, y)/(yx - qxy)$. Recall that the graded centre $Z_{gr}(E(\Lambda))$ of $E(\Lambda)$ is generated by $\{z \in E(\Lambda) \mid z \text{ homogeneous}, z\gamma = (-1)^{\deg z} \deg \gamma z \text{ for all homogeneous } \gamma \in E(\Lambda)\}$. Using that $E(\Lambda)$ is bigraded it is straightforward to compute $Z_{gr}(E(\Lambda))$. If $r$ is even or $\text{char } k = 2$, then $Z_{gr}(E(\Lambda))$ is equal to $H' = k[x^r, y^r]$. Otherwise $Z_{gr}(E(\Lambda))$ is equal to $k[x^r, x^r y^r, y^r]$ and therefore contains $H' = k[x^r, y^r]$. In either case $E(\Lambda)$ is a finitely generated module over $H'$. By [3] or [11] the image of the natural map $HH^*(\Lambda) \rightarrow E(\Lambda)$ is $Z_{gr}(E(\Lambda))$. Take homogeneous inverse images of the two generators of $H'$, and let $H$ denote the polynomial subring of $HH^*(\Lambda)$ they generate. Since $E(\Lambda) \simeq HH^*(\Lambda, S)$
where \( S \) is the only simple \( \Lambda^e \)-module, \( \text{HH}^*(\Lambda) \) is also a finitely generated module over \( H \) as \( H \) is noetherian and \( \Lambda \) is filtered in \( S \) as a \( \Lambda^e \)-module.

2.3. The graded centres of \( E(\Lambda_q) \). By direct calculations and the remarks above we have the following description of the graded centre of \( E(\Lambda_q) \) for all \( q \) in \( k \).

**Proposition 2.1.** The graded centre of \( E(\Lambda_q) \) is as follows.

\[
Z_{gr}(E(\Lambda_q)) = \begin{cases} 
  k, & \text{if } q \text{ is not a root of unity} \\
  k[x^r, y^r], & \text{if } q \text{ is a primitive } r \text{-th unity and } r \text{ even, or} \\
  k[x^{2r}, x^r y^r, y^{2r}], & \text{otherwise}
\end{cases}
\]

3. Further details

In this section we give the full ring structure of \( \text{HH}^*(\Lambda_q) \) and the Hilbert series with respect to the cohomological degree, when \( q \) is an \( r \)-th primitive root of unity and for completeness when \( q = 0 \).

The description of the ring structure of \( \text{HH}^*(\Lambda) \) is divided into several cases. The vector space basis for \( \text{HH}^i(\Lambda) \) for \( i = 0, 1, 2 \) are given in the previous section when \( q \neq 0 \) and below when \( q = 0 \). We first give a vector space basis for \( \text{HH}^i(\Lambda) \) for \( i \geq 3 \) in the different cases, and then the full ring structure of \( \text{HH}^*(\Lambda) \).

The cases we have to consider are the following (a) \( r > 1 \) is odd and \( \text{char} \, k \neq 2 \), (b) \( \text{char} \, k = 2 \) with \( q \neq 1 \), or \( \text{char} \, k \neq 2 \) and \( r > 2 \) is even, (c) \( \text{char} \, k = 2 \) and \( q = 1 \), (d) \( \text{char} \, k \neq 2 \) and \( q = -1 \) and finally (e) \( \text{char} \, k \neq 2 \) and \( q = 1 \).

3.1. The case \( r > 1 \) is odd and \( \text{char} \, k \neq 2 \). In this case representing maps for \( \text{HH}^n(\Lambda) \) when \( n > 2 \) are given by

\[
\text{HH}^n(\Lambda) = \begin{cases} 
  \text{span}_k \{ e_j \}_{j \in \{tr\}_{t=0}^{2r},} & n = 2sr \\\n  \text{span}_k \{ xe_j \}_{j \in \{tr\}_{t=0}^{2r},} & n = 2sr + 1 \\
  \text{span}_k \{ ye_j \}_{j \in \{tr\}_{t=0}^{2r},} & n = 2sr + 2 \\
  0, & \text{otherwise}
\end{cases}
\]

Using the description of the multiplication given in the previous section and remembering that \( n \) is an \( r \)-th root of unity, one can see that

\[
\text{HH}^n(\Lambda) \simeq k[z]/(z^2) \times_k (\wedge^*(u_0, u_1)(u_0, w_1, w_2)/(w_0 w_2 - w_1^2))
\]

where \( z \) is in degree 0, \( u_0 = (x, 0) \) and \( u_1 = (0, y) \) are in degree 1, and \( w_1 : P^{2r} \rightarrow \Lambda \) is in degree 2r and given by \( w_i(e_{ir}) = 1 \) and zero otherwise for \( i = 0, 1, 2 \). We have that \( \sum_{i \geq 0} \dim_k \text{HH}^i(\Lambda)t^i = 1 + \frac{(1+t)^2(1+t^{2r})}{(1-t^r)^2} \).

3.2. The case \( \text{char} \, k = 2 \) with \( q \neq 1 \), or \( \text{char} \, k \neq 2 \) and \( r > 2 \) is even. Representing maps for \( \text{HH}^n(\Lambda) \) when \( n > 2 \) are in this case given by

\[
\text{HH}^n(\Lambda) = \begin{cases} 
  \text{span}_k \{ e_j \}_{j \in \{tr\}_{t=0}^r,} & n = sr \\\n  \text{span}_k \{ xe_j \}_{j \in \{tr+1\}_{t=0}^r,} & n = sr + 1 \\
  \text{span}_k \{ ye_j \}_{j \in \{tr+1\}_{t=0}^r,} & n = sr + 2 \\
  0, & \text{otherwise}
\end{cases}
\]

Similar as above we find that

\[
\text{HH}^n(\Lambda) \simeq k[z]/(z^2) \times_k (\wedge^*(u_1, u_2)(u_0, w_1))
\]
where $z$ is in degree 0, $u_0 = (x, 0)$ and $u_1 = (0, y)$ are in degree 1, and $w_i: P^r \to \Lambda$ is in degree $r$ and given by $w_i(e_j) = 1$ for $j = ir$ and zero otherwise for $i = 0, 1$. The Hilbert series is given by $\sum_{i \geq 0} \dim_k HH^i(\Lambda)t^i = 1 + \frac{(1+t)^2}{(1-t)^2}$.

3.3. The case $\text{char } k = 2$ and $q = 1$. Here the differential in the complex $\text{Hom}_{\Lambda^+}(P, \Lambda)$ is zero, so that all maps in $\text{Hom}_{\Lambda^+}(P^0, \Lambda)$ represent non-zero elements in $HH^*(\Lambda)$. We have that $HH^*(\Lambda) \simeq \Lambda[w_0, w_1]$ where $w_i: P^1 \to \Lambda$ is given by $w_i(e_j) = 1$ for $i = j$ and zero otherwise for $i = 0, 1$. Furthermore $\sum_{i \geq 0} \dim_k HH^i(\Lambda)t^i = \frac{4}{(1-t)^2}$.

3.4. The case $\text{char } k \neq 2$ and $q = -1$. In this case representing maps for $HH^*(\Lambda)$ when $n > 2$ are given by

$$HH^n(\Lambda) = \begin{cases} \text{span}_k \{ (e_j)_{j \in \{2i\}_{i=0}^{\frac{n}{2}-1}} , y e_0 , x e_n , \{ y x e_j \}_{j \in \{2i-1\}_{i=1}^{\frac{n}{2}}} \} , & \text{n even} \\
\text{span}_k \{ (x e_{j-1})_{j \in \{2i-1\}_{i=1}^{\frac{n+1}{2}}} , \{ y e_j \}_{j \in \{2i-1\}_{i=1}^{\frac{n+1}{2}}} , y x e_0 , x e_n \} , & \text{n odd} \end{cases}$$

This gives $HH^*(\Lambda) \simeq (\Lambda \otimes_k 1^* (u_0, u_1)) [w_0, w_1]/(xu_0, yu_1, xw_0, yw_1)$, where $u_0 = (x, 0)$ and $u_1 = (0, y)$ are in degree 1 and $w_0 = (1, 0, 0)$ and $w_1 = (0, 0, 1)$ are in degree 2. The Hilbert series is given by $\sum_{i \geq 0} \dim_k HH^i(\Lambda)t^i = \frac{4-4t+t^2}{(1-2t)^2}$.

As $\Lambda_{-1} \simeq k[x]/(x^2) \otimes_k k[y]/(y^2)$, there is an isomorphism of vector spaces

$$HH^*(\Lambda_{-1}) \simeq HH^*(k[x]/(x^2)) \otimes_k HH^*(k[y]/(y^2))$$

$$\simeq (k[x]/(x^2) \times_k 1^* (u_0) [w_0]) \otimes_k (k[y]/(y^2) \times_k 1^* (u_1) [w_1])$$

by [12, Chap. X, Theorem 7.4], which is in accordance with our result!

3.5. The case $\text{char } k \neq 2$ and $q = 1$. In this case representing maps for $HH^*(\Lambda)$ when $n > 2$ are given by

$$HH^n(\Lambda) = \begin{cases} \text{span}_k \{ (e_j)_{j=0}^{\frac{n}{2}}, \{ y x e_j \}_{j=0}^{\frac{n}{2}} \} , & \text{n even} \\
\text{span}_k \{ (x e_j)_{j=0}^{\frac{n+1}{2}}, \{ y e_j \}_{j=0}^{\frac{n+1}{2}} \} , & \text{n odd} \end{cases}$$

It follows that

$$HH^*(\Lambda) \simeq \left( k[z]/(z^2) \times_k 1^* (u_0, u_1, u_2, u_3) \right) [w_0, w_1, w_2]/I,$$

where $z$ is in degree 0, $u_0 = (x, 0)$, $u_1 = (y, 0)$, $u_2 = (0, x)$, $u_3 = (0, y)$ are in degree 1, and $w_i: P^2 \to \Lambda$ is given by $w_i(e_j) = 1$ for $j = i$ and zero otherwise for $i = 0, 1, 2$. The ideal $I$ is given by

$$(u_0 u_2, u_1 u_3, u_0 u_1 + zw_0, u_0 u_3 + zw_1, u_2 u_3 + zw_2, u_1 u_2 - zw_1,$$

$$u_0 w_1 - u_2 w_0, u_1 w_1 - u_3 w_0, u_0 w_2 - u_2 w_1, u_1 w_2 - u_3 w_1, w_0 w_2 - w_1^2)$$

We have that $\sum_{i \geq 0} \dim_k HH^i(\Lambda)t^i = \frac{2}{(1-t)^2}$. 

3.6. The case $q = 0$. For completeness we now consider the degenerate case when $q = 0$. We have that the centre of $\Lambda$ is given by $\text{span}_k \{1, yx\}$, so that $\text{HH}^0(\Lambda) = \text{span}_k \{(x, 0), (0, y)\}$. For $n > 1$ the representing maps for $\text{HH}^n(\Lambda)$ are

$$\text{span}_k \{(xe_i)^{n-2}, ye_n, \{yx e_i\}_{i=1}^{n-1}\}.$$ 

It follows from this that all products in $\text{HH}^{2i}(\Lambda)$ are zero. Hence the Hochschild cohomology ring of $\Lambda$ is isomorphic to

$$k[[v_{00}, v_{10}, v_{11}, \ldots, t]]/\langle v_{ij}v_{i'j}' \rangle,$$

where $v_{ij}$ is in degree $i$. Finally $\sum_{i \geq 0} \dim_k \text{HH}^i(\Lambda)t^i = \frac{1+t^3}{(1-t)^2}$.
