

APPENDIX A	2
APPENDIX B	3
APPENDIX C	4
APPENDIX D	10

Appendix A: Plots of selected controlled process models

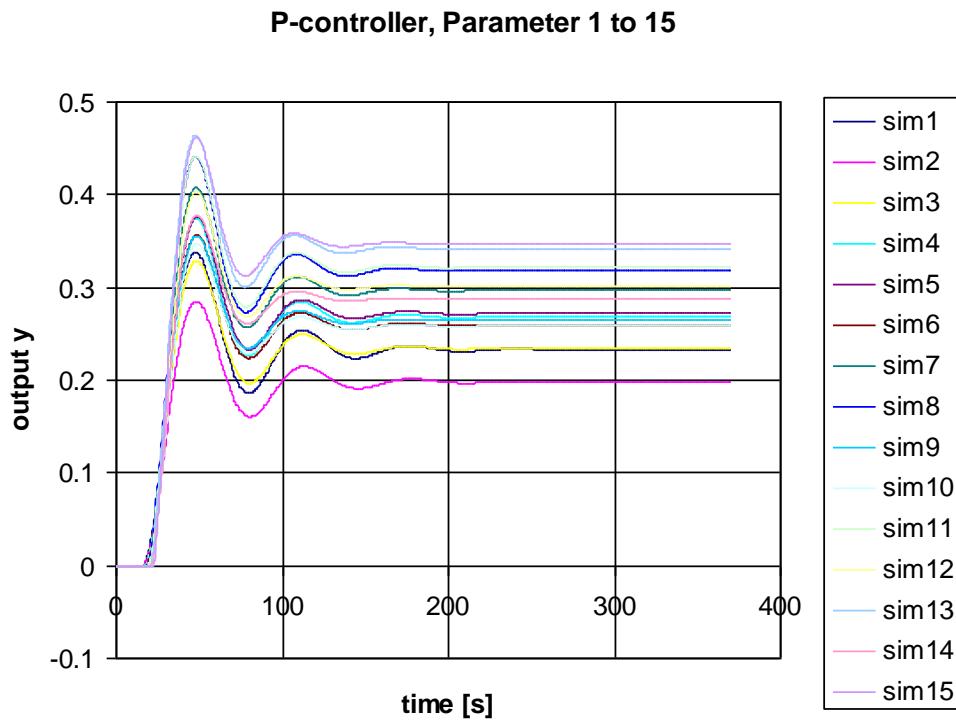

Figure I Results of Process 4 simulation with P-controller.

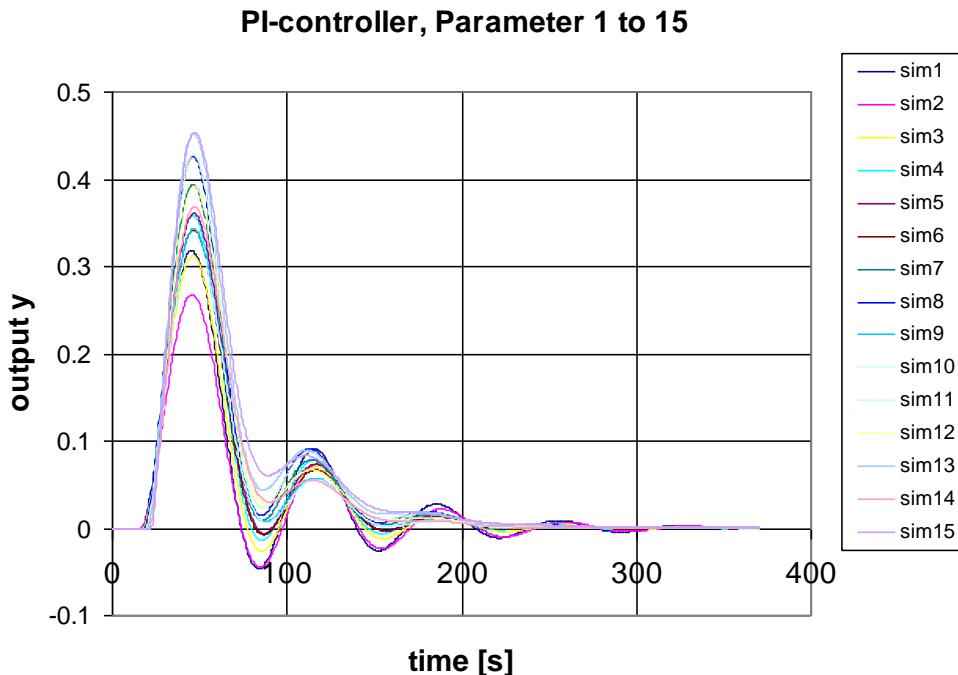

Figure II Results of Process 4 simulation with PI-controller.

Appendix B: Matlab code for calculation of IAE and TV

The processes were simulated in Simulink, and IAE and TV were calculated in Matlab by using the script IAEandTV.m

```
% beregninger av IAE og TV for settpunktsendringer
s = [1 0]; % 1 for settpunktetring og 0 for load change
step=ys(2,1)-ys(1,1); % Benyttet konstant steglengde, krav for Simpsons
% y output er lagret i ys- for settpunktsendring
for i=2:length(ys(:,1)) % antall y rekkevektorer (-1 for tid-vektor)
    e=abs(ys(:,i)-s(1)); % avviket fra settpunktet
    m=[1:2:N-2]; % indexer for IAE beregninger
    % Simpson's 1/3 regelen anvendes. Den kan anvendes ved odde antall målinger
    % evt partall antall subintervaller
    IAE = sum(step/3*(e(m)+4*e(m+1)+e(m+2)));%beregner
    IAE_set((i-1),:)=IAE;
end
% Beregner Total Variasjonen(TV) i output(u) fra
% controlleren for settpunktsendring
for i=2:length(us(:,1))
    N=length(yd); % antall funksjonsevalueringer
    u_s=us(:,i);
    k=[2:1:N]; % indexer for TV beregninger
    TV = sum(abs(u_s(k)-u_s(k-1))); % TV=sum(abs[x
    TV_set(i-1,:)=TV;
end
% beregninger av IAE og TV for loadchange
step=y_load(2,1)-y_load(1,1); % Benyttet konstant steglengde, krav for Simpsons
% y output er lagret i yload- for settpunktsendring
for i=2:length(y_load(:,1)) % antall y rekkevektorer (-1 for tid-vektor)
    e=abs(y_load(:,i)-s(2)); % avviket fra settpunktet
    m=[1:2:N-2]; % indexer for IAE beregninger
    % Simpson's 1/3 regelen anvendes. Den kan anvendes ved odde antall målinger
    % evt partall antall subintervaller
    IAE = sum(step/3*(e(m)+4*e(m+1)+e(m+2)));%beregner
    IAE_load(i-1,:)=IAE;
end
% Beregner Total Variasjonen(TV) i output(u) fra
% controlleren for load change
for i=2:length(u_load(:,1))
    N=length(u_load); % antall funksjonsevalueringer
    u_load=u_load(:,i);
    k=[2:1:N]; % indexer for TV beregninger
    TV = sum(abs(u_load(k)-u_load(k-1)));
    TV_load(i-1,:)=TV;
end
IAE_set %Resultater
TV_set
IAE_load
TV_load
```

Appendix C: Plots of simulated models for analysis of IAE and TV

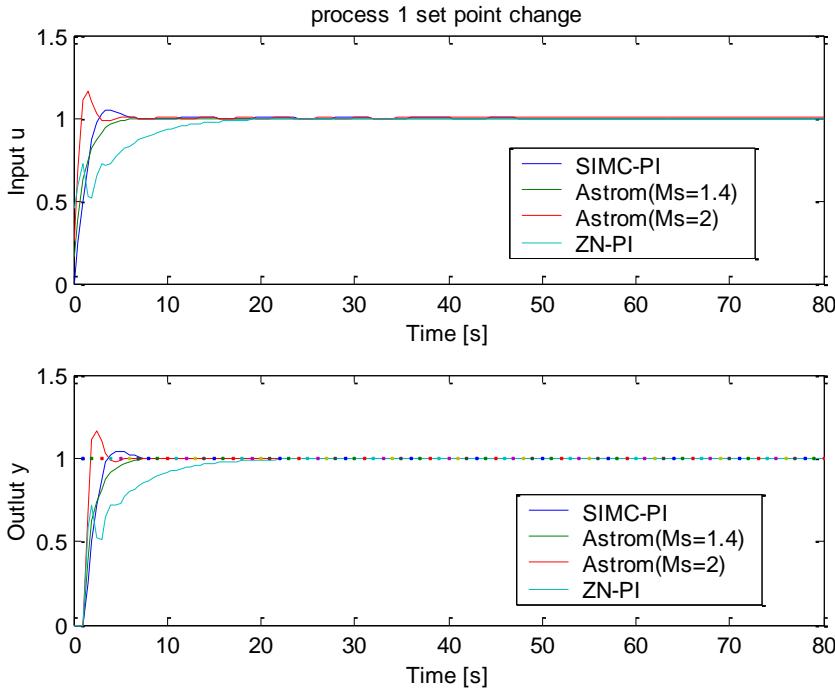

Figure III Pure dead time process, set point change.

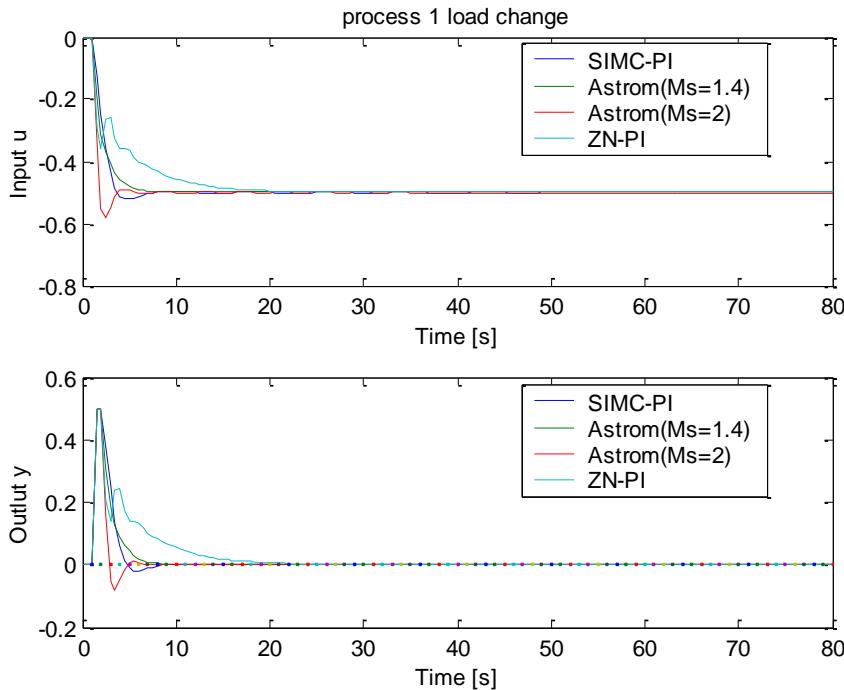

Figure IV Pure dead time process, load change.

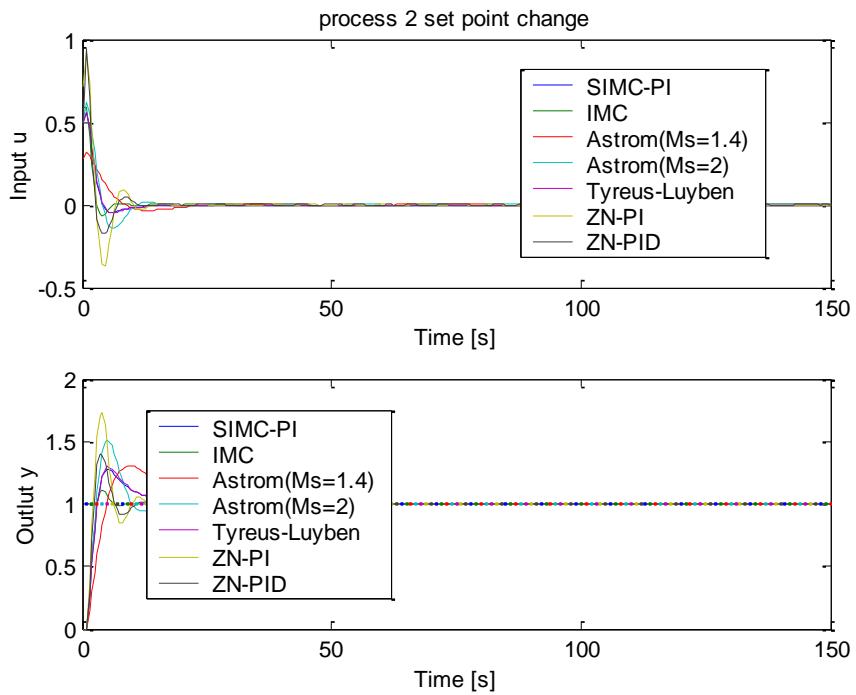

Figure V Integrating process, set point change.

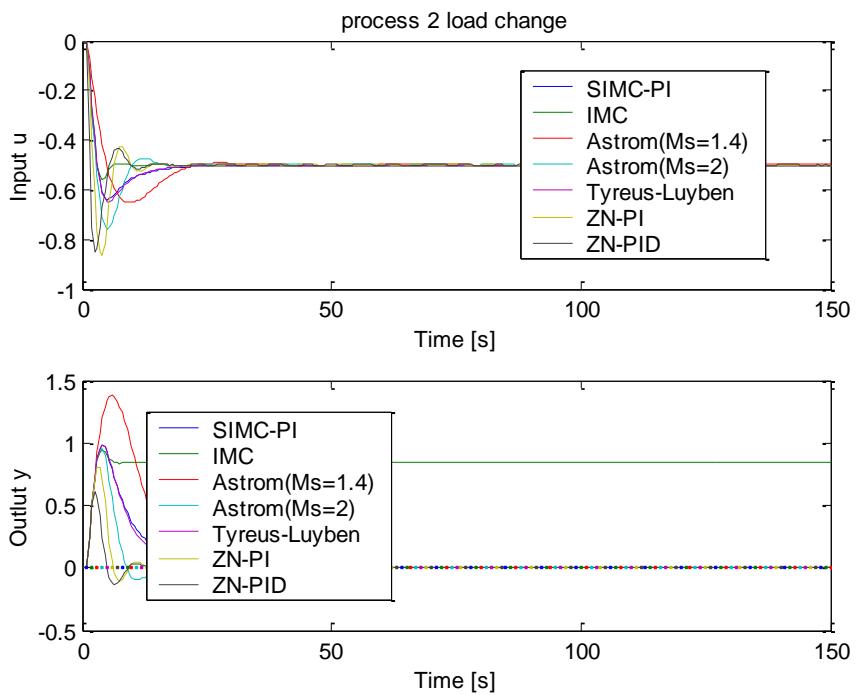

Figure VI Integrating process, load change.

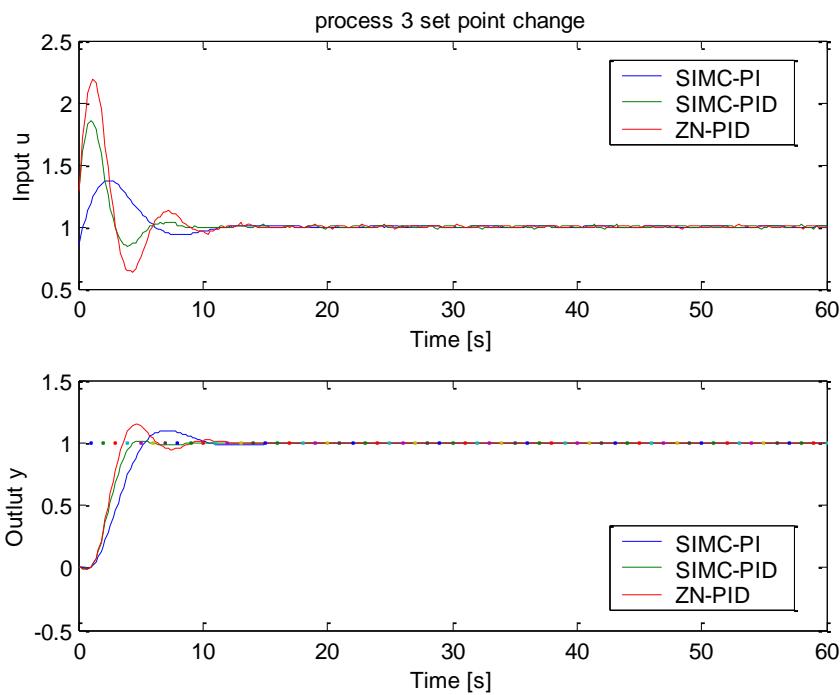

Figure VII Process example G₃, set point change.

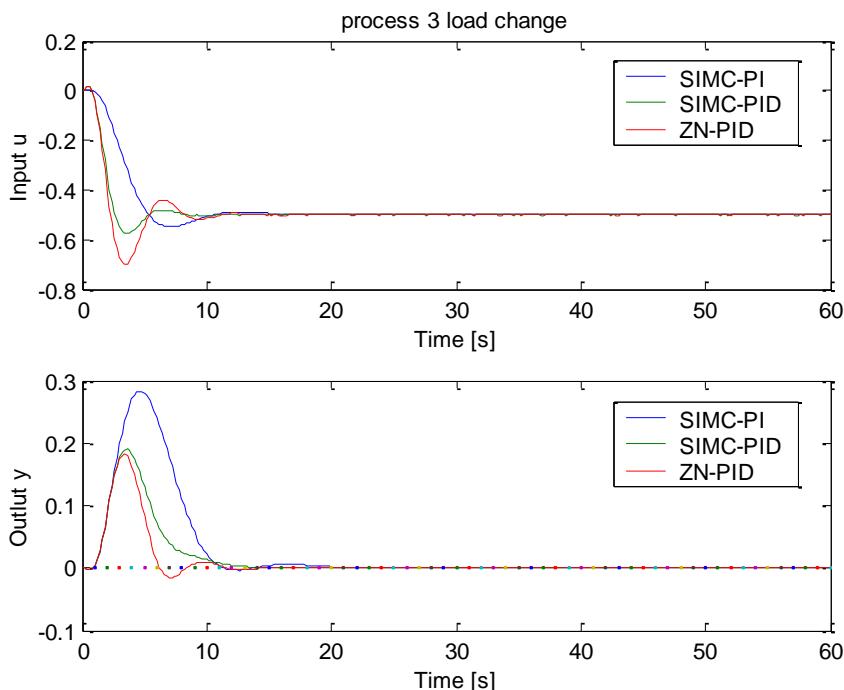

Figure VIII Process example G₃, load change.

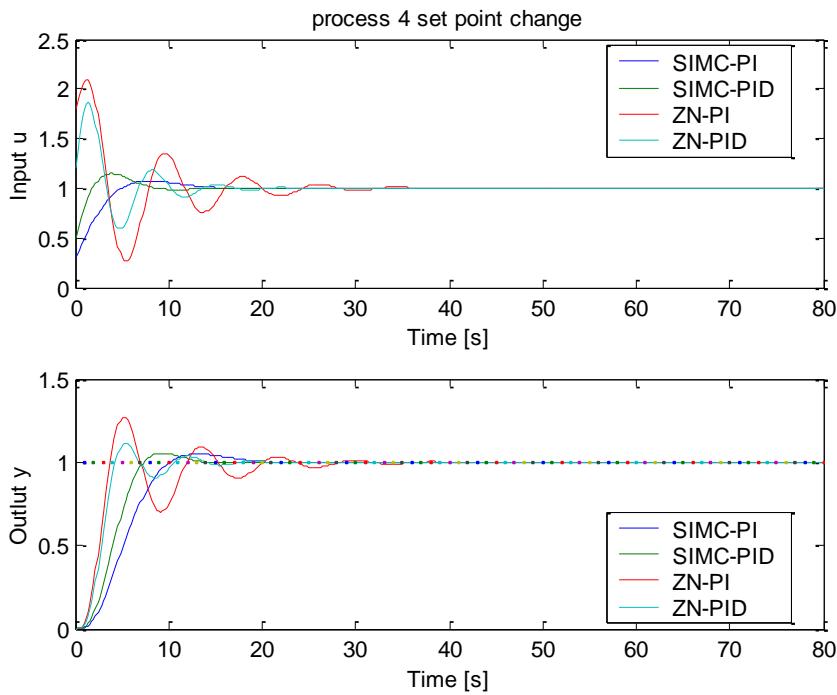

Figure IX Process example G₄, set point change.

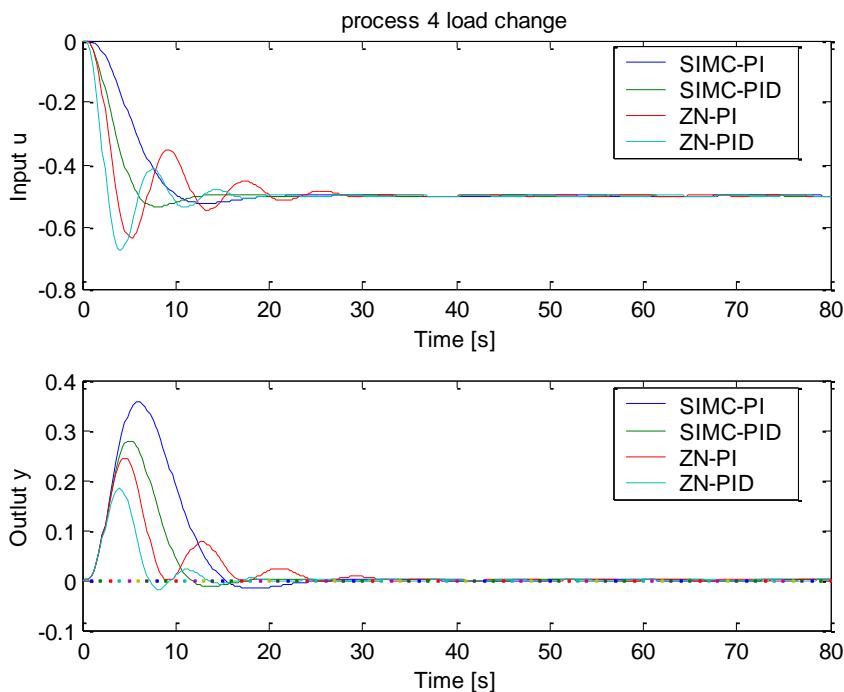

Figure X Process example G₄, load change.

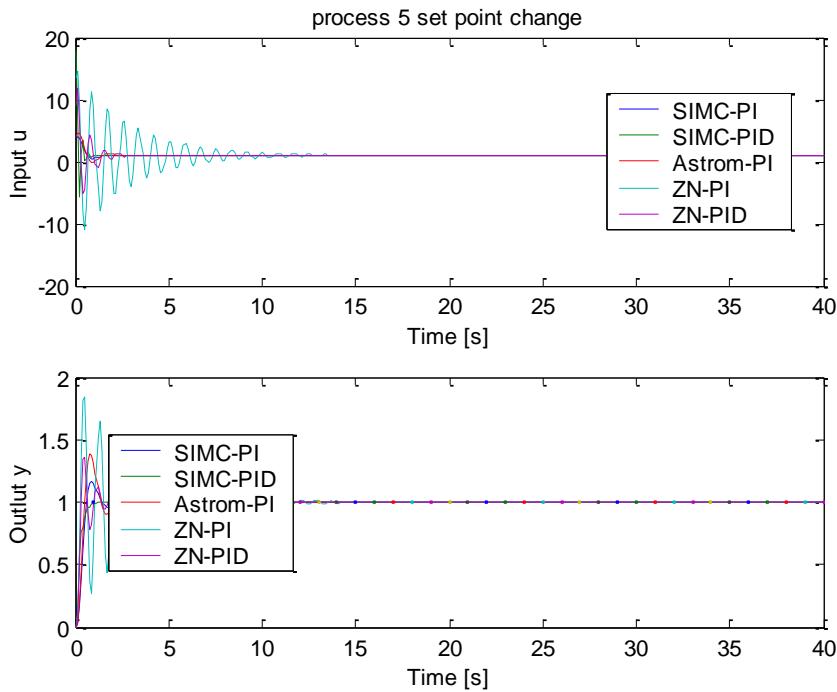

Figure XI Process example G₅, set point change.

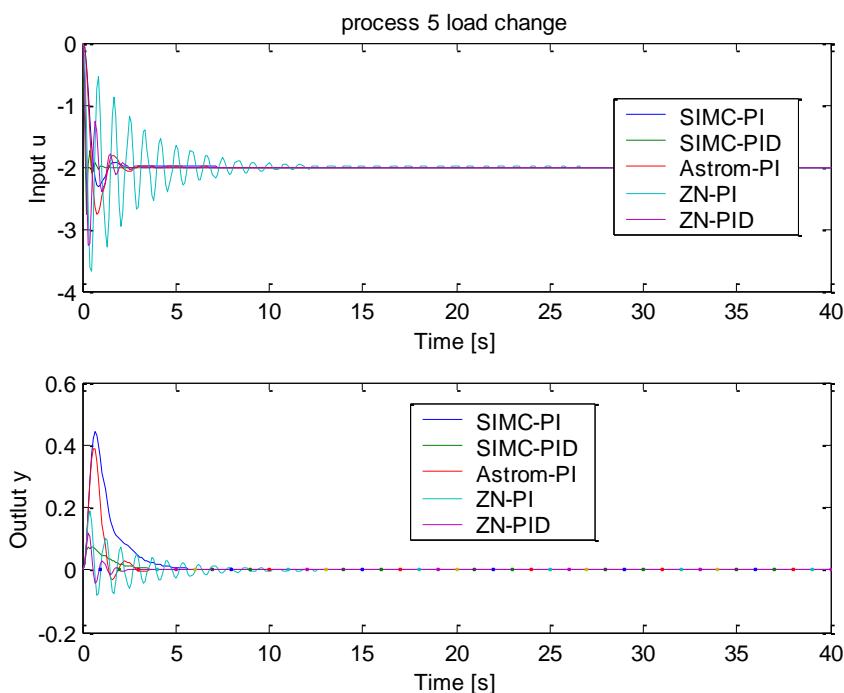

Figure XII Process example G₅, load change.

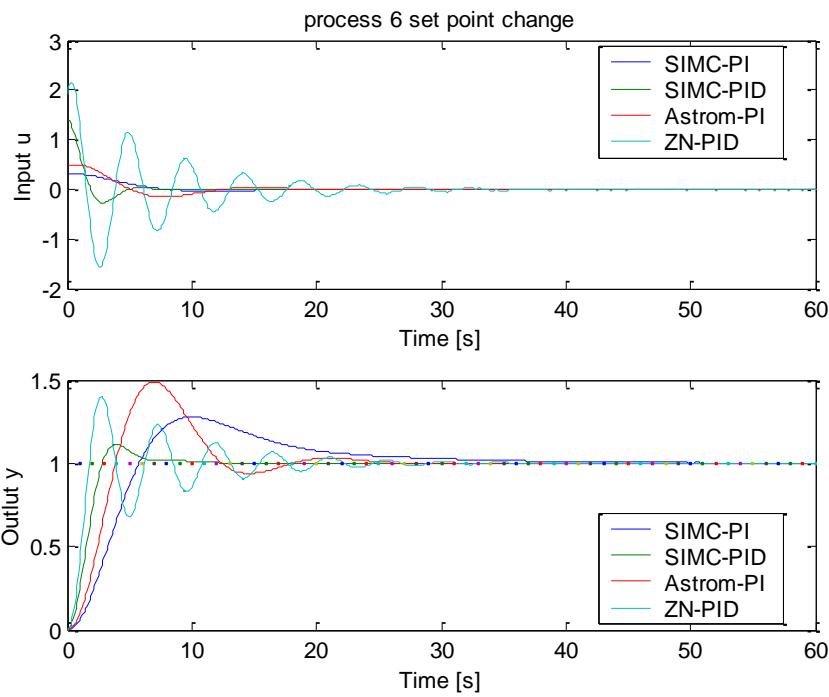

Figure XIII Process example G₅, set point change.

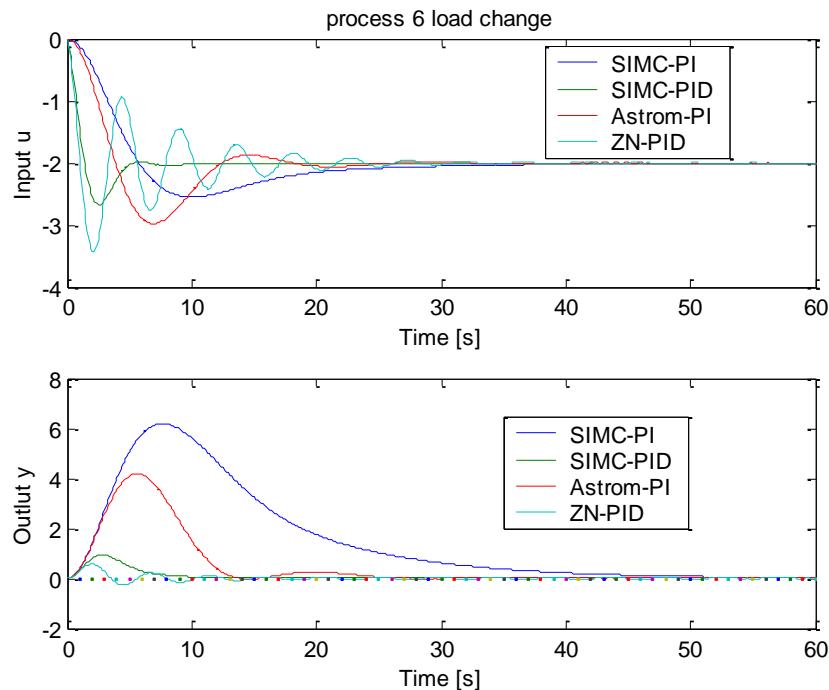

Figure XIV Process example G₆, load change.

Appendix D: Matlab code for frequency analysis routine

minbode.m routine

```
function [A,vA,w180,wc,GM,PM,Ms,Mt]=minbode_L(num,den,gain,deadtime,w)
%Frequency analysis of SISO system L= gain*deadtime*num/den
%By Truls Larsson, Trondheim 15.09.98 and 21.09.98
%
%Kall: minbode(num,den,gain,deadtime,w)
%gir: Bode-plott av L samt frekvensplott av |S| og |T| (S=1/1+L; T=L/1+L)
%
%eller: [A,vA,w180,wc,GM,PM,Ms,Mt]=minbode(num,den,gain,deadtime,w)
%gir: amplitude (A) og fase (vA) av L som funksjon av frekvens,
%     w180 (der va=-180 grader), wc (der A=1), GM, PM,
%     samt Ms (peak for |S|) og Mt (peak for |T|)
%
%Input:
%num    : er teller polynomet
%den    : er nevner polynomet
%gain   : er forsterkning
%deadtime : er dodtid
%w      : er frekvensene (NB! omraadet maa vaere stort nok)
%Eksempel:
%num=[2 1]; den=[25 10 1 0]; gain=0.1; deadtime=3; w= logspace(-2,2,100);
%
if nargin==0
