Model for Pressure Drop -The Wallis Equation-

$$\sqrt{C_S^*} + m\sqrt{C_L^*} = c$$

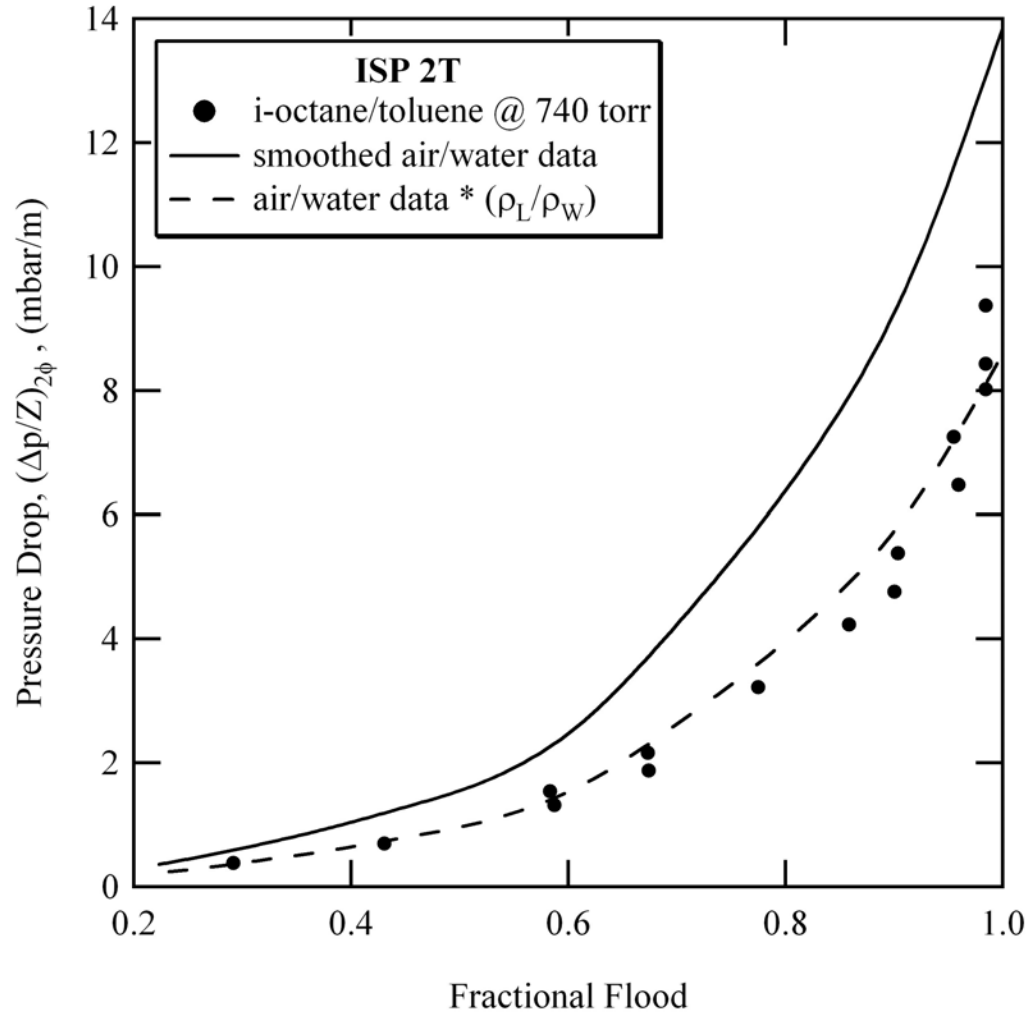

Dimensional Similitude and Experiment Imply That the Wallis Parameters Scale As

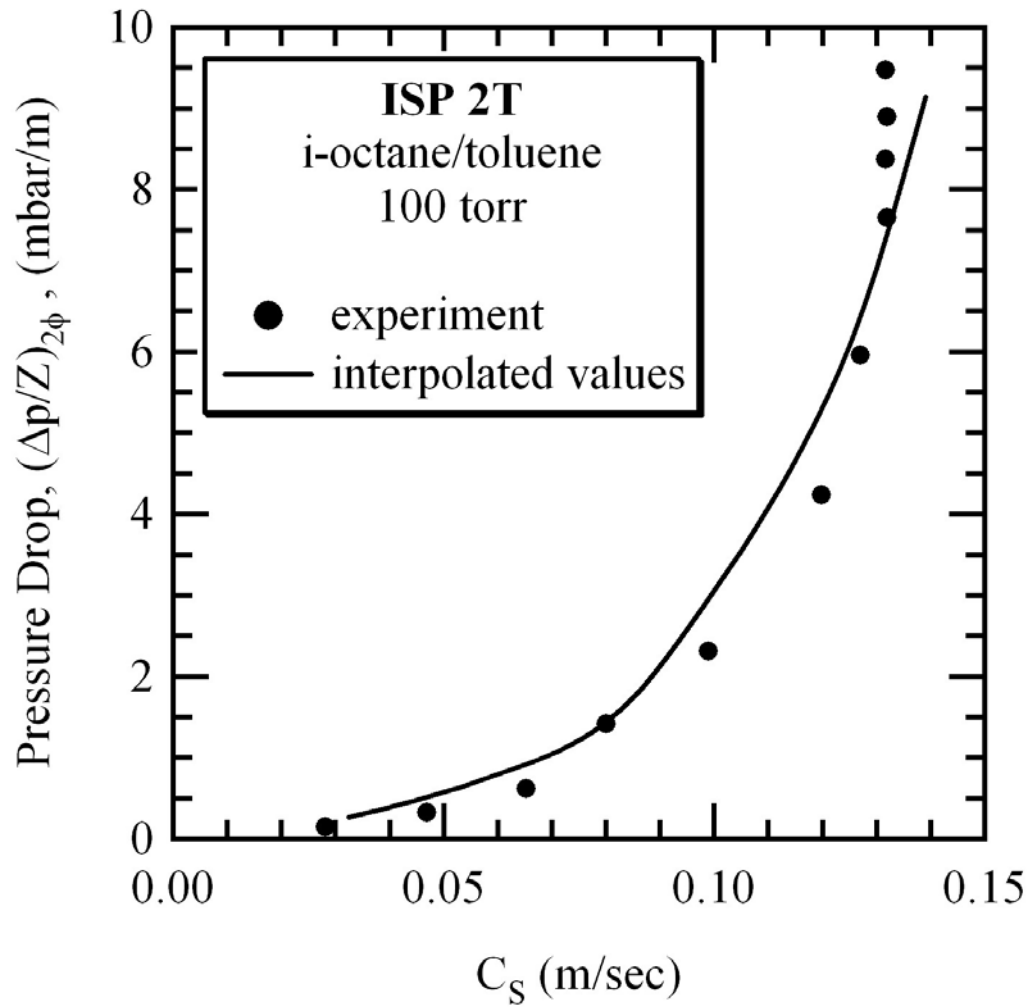

$$m \propto \left(\frac{d_H^2 \rho_L g}{\sigma_L} \right)^{b'}$$

$$c \propto (g d_H \varepsilon^2)^{1/4} \left(\frac{d_H^2 \rho_L g}{\sigma_L} \right)^y$$

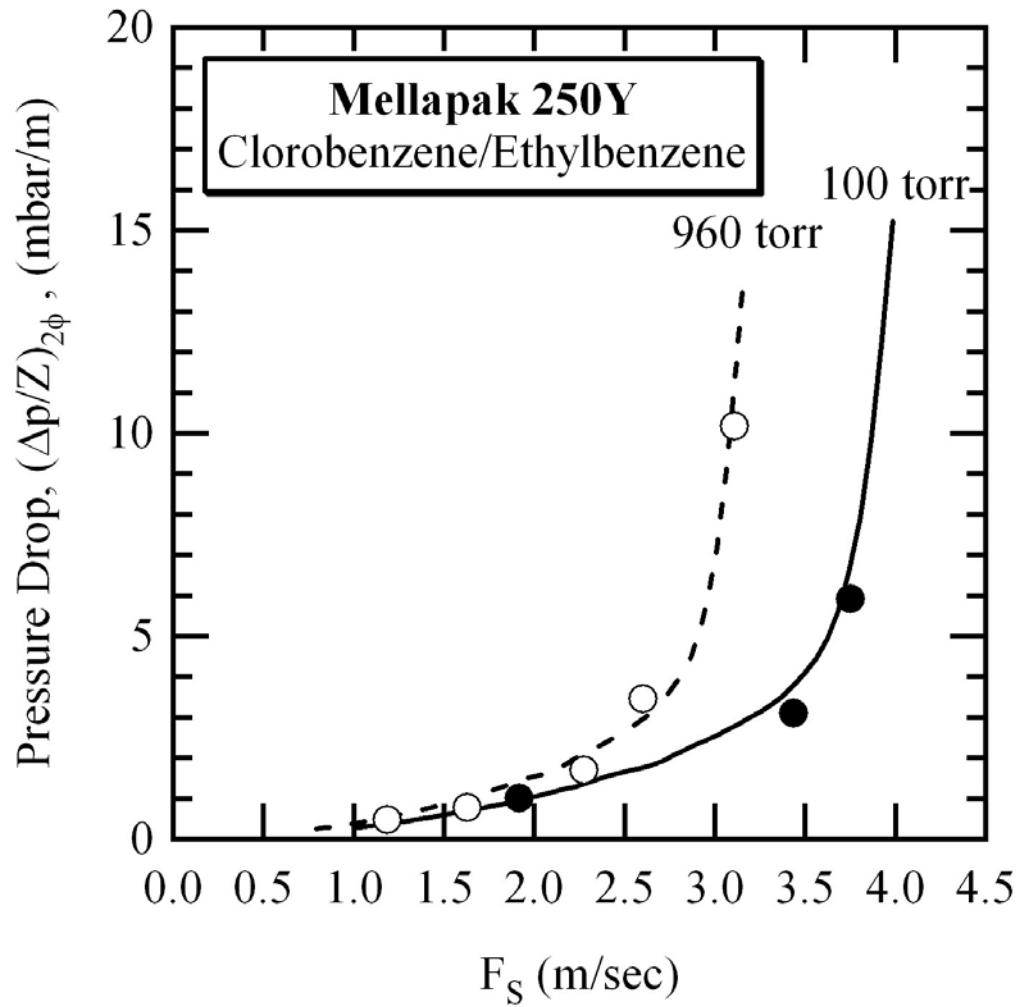

Air/Water Collapse Doesn't Predict Pressure Drop For Another Liquid Directly

Final Model Formulation

Values Can Be Obtained from Interpolation

$$\frac{(\Delta p/Z)_{2\phi}}{\rho_L g} = \Pi(\mathfrak{S}) \text{ and } \mathfrak{S} = C_S / C_{S,F} = F_S / F_{S,F}$$

$$\mathfrak{S} = \frac{C_S}{C_{S,F}} = \frac{C_S}{\left(c_W \left[\frac{\rho_L \sigma_W}{\rho_W \sigma_L} \right]^{(\gamma-1/4)/2} - m_W \left[\frac{\rho_L \sigma_W}{\rho_W \sigma_L} \right]^{\beta/2} \sqrt{C_L} \right)^2}$$
